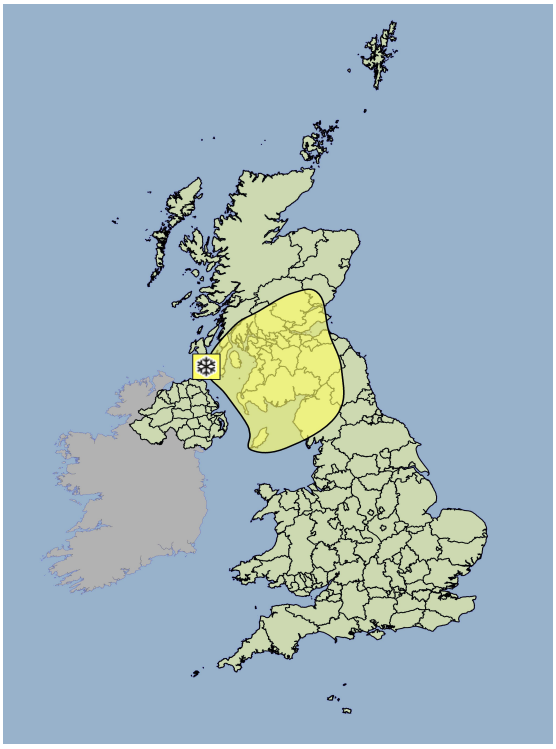
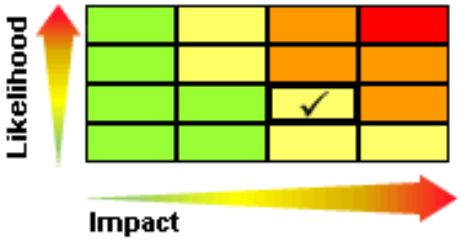
National Severe Weather Warning Service





Chief Forecasters Assessment
A complex depression is likely to run northeastwards across the UK on Saturday. As the associated frontal system encounters colder air across northern Britain, the rain is likely to turn to snow at least on higher routes. Any heavy precipitation could bring wet snow down to lower levels. Computer models are still giving differing indications regarding the location of the main snow risk hence there is greater than usual uncertainty over these developments. Therefore the public should keep up to date with the latest forecasts.

The Met Office have issued a **Yellow Warning** of **Snow**

Valid from **09:00 on Sat, 04th Jan 2014** until **20:00 on Sat, 04th Jan 2014**

Outbreaks of rain, sleet and snow will spread northwards on Saturday. The snow mainly confined to higher ground above about 150 metres where accumulations of several centimetres are possible, but temporary slight slushy deposits at lower levels possible in heavier precipitation. Gradually clearing from the south through the afternoon and evening. The situation is finely-balanced and there remains considerable uncertainty regarding the extent of any snow. Hence the public should watch for further updates to this warning.
